

# CWT Coring Lab Guide

A **CODED WIRE TAG (CWT)** is a small piece of wire etched with a code and injected into snouts of juvenile salmon and steelhead

## 1 LAB STATION ESSENTIALS

## 2 ISOLATE

Confirm presence of CWT with V-Detector

Isolate CWT by coring and cutting

### CORING PREP & POSITION

- 1 Frozen & clean
- 2 Lower jaw removed
- 3 Place on safety plate under coring cylinder

**NOTE:** Variation in head/snout size may effect placement under corer and the overall safety of operation

### ISOLATE CWT FROM CORE

- 1 Cut core in halves
- 2 Run each piece by V-detector
- 3 Repeat cutting & scanning until CWT is isolated

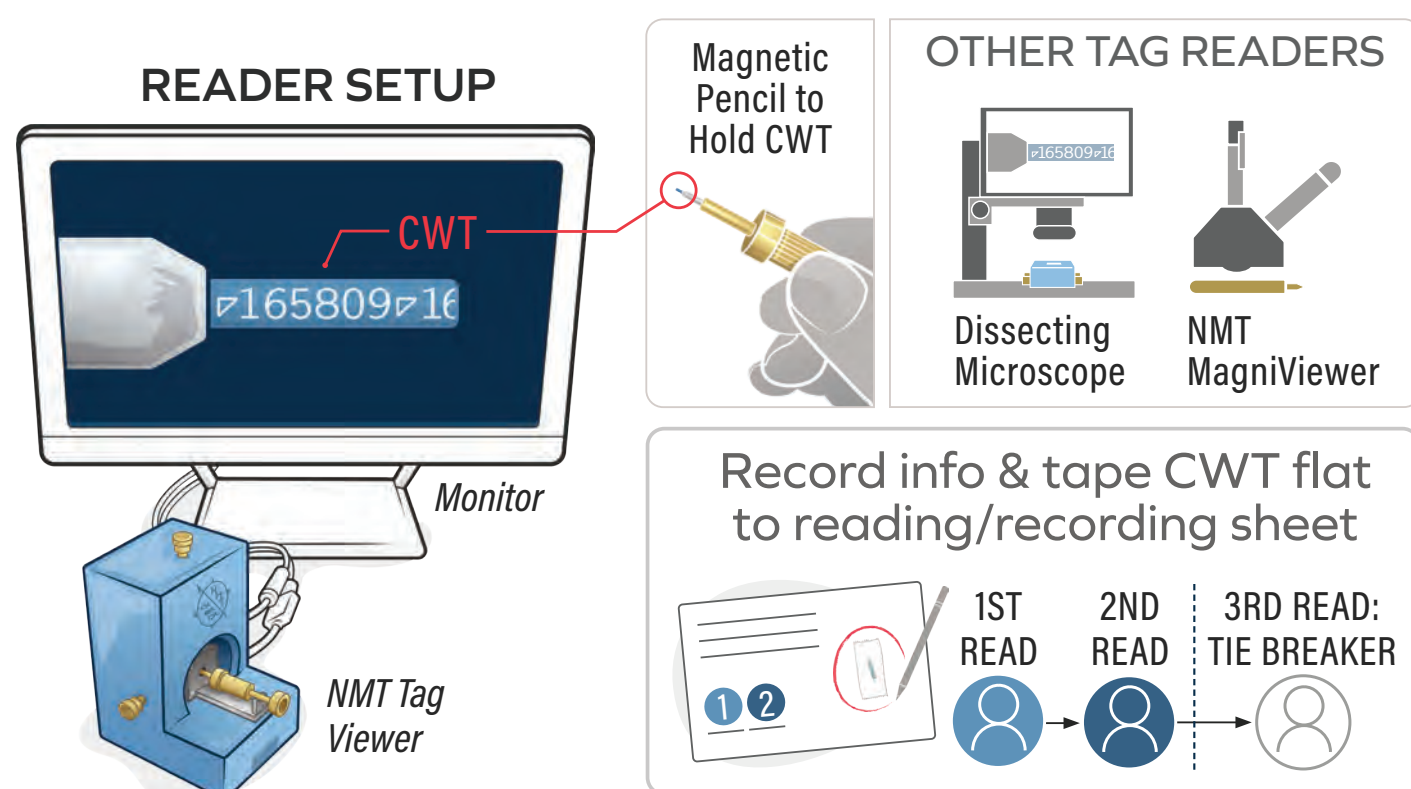

Keep hands clear of corer while in use

Only divide tissue that produces a signal

## 3 READ & RECORD

Identify CWT code and attach CWT to reading/recording sheet

## 4 STORE

Sort and file reading/recording sheets with attached CWT

For more detail, scan code for CWT Recommended Procedures Documents

Pacific States Marine Fisheries Commission © 2024

Clean and organize the lab workspace before and after CWT extraction.
